

Ex 1

Create an application using the make command

25.08.22

Aim:

To use gcc to compile c-programs. Split the programs to different modules and create an application using make command.

Algorithm:

1. Create a file with .c extension in ubuntu system
2. Add your program to the file
3. Create two more c files and a makefile

Program:

Sample.c

```
#include<stdio.h>
void main()
{
int a=5,b=3,c;
c=a+b;
printf("\n addition =%d",c);
}
```

Makefile By Example

```
#include<stdio.h>
void main()
{
int a=5,b=3,c;
c=a+b;
printf("\n addition =%d",c);
}
```

To Create a file makefile

Syntax:

```
target: pre-req-1 pre-req-2 ...
command
```

The target and pre-requisites are separated by a colon (:). The command must be preceded by a tab

```
all: sample.exe
```

```
sample.exe: sample.o
```

```
gcc -o sample.exe sample.o
```

```
sample.o: sample.c
```

```
gcc -c sample.c
```

```
clean:
```

```
rm sample.o sample.exe
```

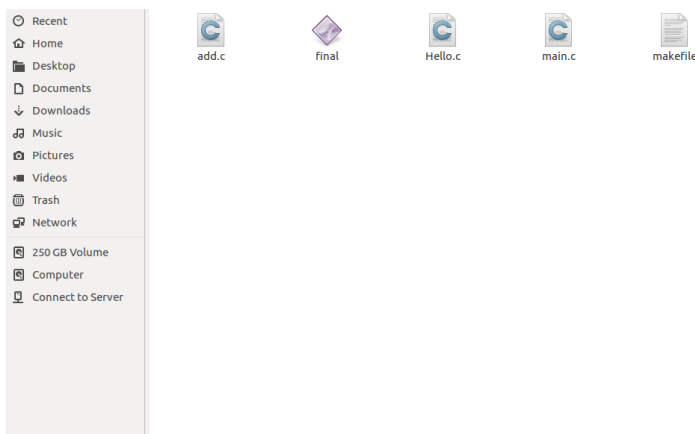

When make is asked to evaluate a rule, it begins by finding the files in the prerequisites. If any of the prerequisites have an associated rule, make attempts to update those first.

You can then run the make without a target, which is the same as "make all".

```
> make clean
```

```
> make
```

Output:

```
student@student-ThinkCentre-M71e:~$ gedit makefile
student@student-ThinkCentre-M71e:~$ make final
gcc Sample.c Hello.c add.c -o final
Sample.c: In function 'main':
Sample.c:6:1: warning: implicit declaration of function 'hello' [-Wimplicit-func
tion-declaration]
  hello();
  ^
Sample.c:8:1: warning: implicit declaration of function 'add' [-Wimplicit-functi
on-declaration]
  add(3,6);
  ^
student@student-ThinkCentre-M71e:~$ ./final

I am in main.c

calling hello function
I am in hello.c
PID of hello.c is 3436/n
calling add function

addition =9
back in main.c
```

Result:

Thus an application was created using make command

Ex 2

Version control systems command

30.08.22

Aim:

To use version control systems command to clone, commit, push, fetch, pull, checkout, reset, and delete repositories.

Algorithm:

1. Install git and initialize empty git repository
2. Create Repository and move your local folder to the repository
3. Create file and check status of the file
4. Commit the changes of the file and push it to the repository
5. To create a new repository as repository in terminal:
6. Click + plus on the right side of your GITHUB profile -> Click new repository -> type new repository name as repository name in your terminal -> give some data in the description field
eg(test) - > click create repository

Output:

```
student@student-ThinkCentre-M71e: ~
--- a/test.txt
+++ b/test.txt

commit 36f647c5f69c1befa9a0235c1daf0449dd2cf444

Author: student <student>

Date: Thu Aug 25 15:32:38 2022 +0530

second commit

commit 1fbcf2c15628c762768e96a8031c49f6fccded07

Author: student <student>

Date: Thu Aug 25 15:26:56 2022 +0530

initial commit

Result:

Thus, version control systems commands were used to clone, commit, push, fetch, pull, checkout, reset, and delete repositories.

Ex 3

Install Virtualbox/VMware Workstation

08.09.22

Aim:

To install Virtualbox/VMware Workstation with different flavors of linux or windows OS on top of windows7 or 8.

Procedure:

Step 1- Download link and the software for windows.

Step 2- Download the installer file

Step 3- Select Installation Location:

Step 4- Give install option

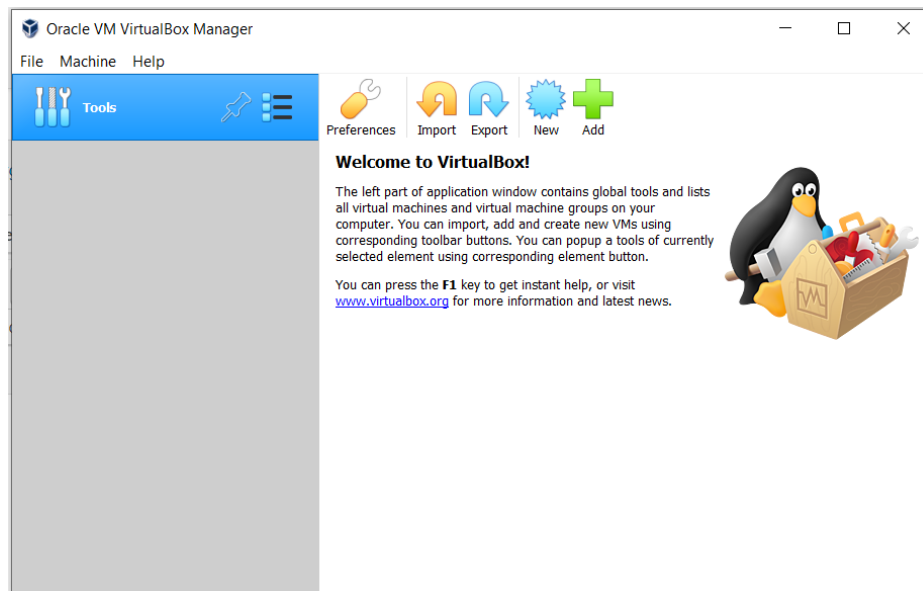

Step 4- Grant admin permission to install

Step 5- Open the installed virtual box

Step 6- Create a VM and add ubuntu in it

Output:

Result:

Thus, virtualbox/VMware Workstation is installed successfully.

Ex 4
08.09.22

Setting up C Programming Environment

Aim:

To install a C compiler in the virtual machine created using virtual box and execute Simple Programs.

Procedure:

1. Open Terminal (Applications-Accessories-Terminal)
2. Open gedit by typing “gedit &” on terminal and type the code in the editor
3. Type “ls” on Terminal to see all files under current folder
4. Confirm that “palindrome.c” is in the current directory. If not, type cd DIRECTORY_PATH to go to the directory that has “palindrome.c”
5. Type “gcc palindrome.c” to compile, and type “ls” to confirm that a new executable file “a.out” is created
6. Type “./a.out” on Terminal to run the program
7. If you see your output on the screen, on the next line, you just successfully ran your first C program!

Output:

Palindrome.c

```
#include<stdio.h>
int main()
{ int n,r,sum=0,temp;
scanf(“%d”,&n);
temp=n;
while(temp>0) {
r=temp%10;
sum=sum+r;
temp/=10; }
if(sum==n)
printf(“Palindrome”);
else
printf(“Not a palindrome”); }
```

Fibonacci.c

```
#include<stdio.h>
int main() {
```

```

int n1=0,n2=1,n3,i,number;
printf("Enter the number of elements:");
scanf("%d",&number); printf("\n%d %d",n1,n2);
for(i=2;i<number;++i) {
n3=n1+n2;
printf(" %d",n3); n1=n2;
n2=n3; } }

```

Armstrong.c

```

#include<stdio.h>
int main() {
int n,r,sum=0,temp;
printf("enter the number=");
scanf("%d",&n);
temp=n;
while(n>0) {
r=n%10;
sum=sum+(r*r*r);
n=n/10; }
if(temp==sum)
printf("armstrong number ");
else
printf("not armstrong number"); }

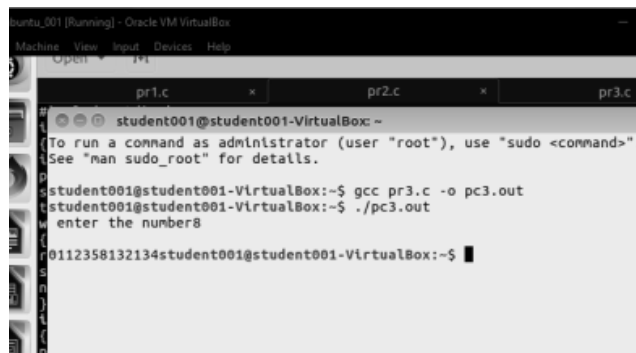

```

Output:

```

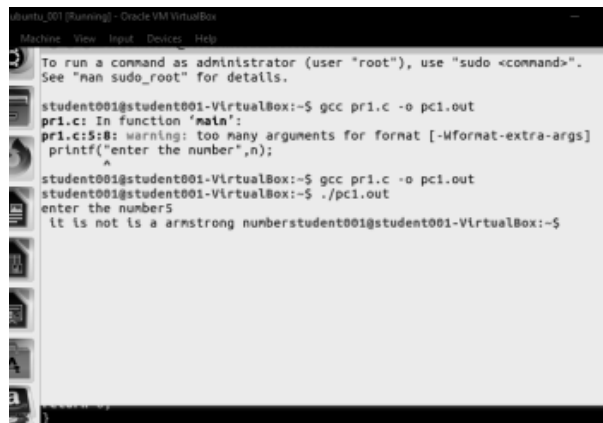

pr1.c x pr2.c x pr3.c
student001@student001-VirtualBox: ~
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.
student001@student001-VirtualBox:~$ gcc pr3.c -o pc3.out
student001@student001-VirtualBox:~$ ./pc3.out
enter the number8
0112358132134student001@student001-VirtualBox:~$

```

```
pr1.c x pr2.c x pr3.c
# student001@student001-VirtualBox: ~
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

student001@student001-VirtualBox:~$ gcc pr3.c -o pc3.out
student001@student001-VirtualBox:~$ ./pc3.out
enter the number8
0112358132134student001@student001-VirtualBox:~$
```

```
student001@student001-VirtualBox:~$ gcc pr1.c -o pc1.out
pr1.c: In function 'main':
pr1.c:5:8: warning: too many arguments for format [-Wformat-extra-args]
printf("enter the number",n);
^
student001@student001-VirtualBox:~$ gcc pr1.c -o pc1.out
student001@student001-VirtualBox:~$ ./pc1.out
enter the number5
it is not is a armstrong numberstudent001@student001-VirtualBox:~$
```

Result:

Thus, C compiler was installed in the VM and simple programs were executed successfully

Ex-5 Google App Engine Installation and Simple Programming in GAE

15.09.22

Aim:

To Install Google App Engine. Create a hello world app and other simple web applications using python/java.

Algorithm

Step 1: Install the cloud SDK in the specified link: <https://cloud.google.com/sdk/docs/install>

Step 2: Once the installation is done open the installed Cloud shell

Step 3: It will prompt you to login with email id of any google account, so sign in with your google account

Step 4: Choose a new project to be created by typing any name

Step 5: Create a new folder inside C drive (eg. cclabex6) Now move into that folder by the command

Cd cclabex6

Upload the code to your github repository or clone the existing repository of helloworld from the link: <https://github.com/GoogleCloudPlatform/python-docs-samples/>

Step 6: Change the directory which contains hello world code as:

cd C:\cclabex6\python-docs-samples\appengine\standard_python3\hello_world

Step 7: Install the requirements like flask needed for the application using the command: pip install -r requirements.txt

Step 8: Provided python is preinstalled in the system execute the command: python main.py

Step 9: This will make the application run in the localhost port :

<http://127.0.0.1:8080/>

Step 10: Record the displayed webapp's output.

Output:

```

#
import os
import webapp2
from google.appengine.ext.webapp import template

class MainPage(webapp2.RequestHandler):
    def get(self):
        template_values = {}
        path = os.path.join(os.path.dirname(__file__),
                             'index.html')
        self.response.out.write(template.render(path,
        template_values))

app = webapp2.WSGIApplication([('/', MainPage)], debug=True)
```

Output:

A screenshot of a web browser window. The address bar shows 'localhost:8080'. The page title is 'Page Title'. The main content area displays the text 'Hello World' in bold. Below this, there are two input fields: 'Username :' and 'Password :'. At the bottom left, there is a 'Submit' button.

Result:

Thus a web application was successfully launched using GAE

Exp 7

File transfer from one virtual machine to another

29.09.22

Aim:

To find a procedure to transfer the files from one virtual machine to another virtual machine.

Procedure:

1. Create two virtual Machines.

2. Follow the steps to Create NATNetwork .

File->preferences->Network-> NATNetwork -> Add NATNetwork

3. Select a NATNetwork for created VMs

Ex: VM1->settings->Network->Attached to: NATNetwork

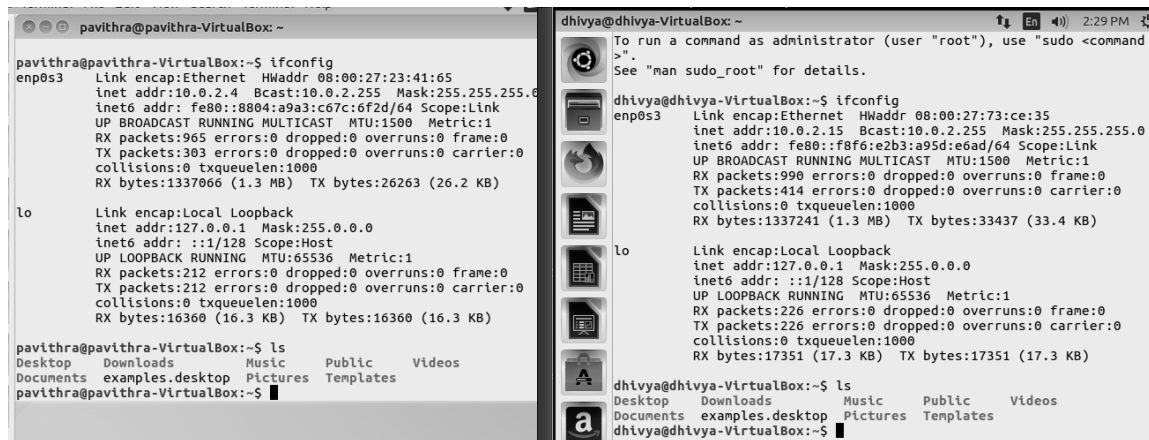

->Choose your created NATNetwork name

Click OK

4. Open the two VMs

5. Open Terminal on your VMs

Output:

The screenshot displays two side-by-side terminal windows from VirtualBox. The left window, titled 'pavithra@pavithra-VirtualBox: ~', shows the output of the 'ifconfig' command for the 'enp0s3' interface, displaying Ethernet details and statistics. It also shows the configuration for the 'lo' (loopback) interface. Finally, it lists the contents of the current directory using 'ls', showing folders like Desktop, Downloads, Music, Public, and Videos. The right window, titled 'dhivya@dhivya-VirtualBox: ~', shows a similar 'ifconfig' output for its 'enp0s3' interface. It also displays the 'lo' interface configuration and the output of the 'ls' command, which is identical to the left window. Both windows show the user is at the root prompt (~\$).

```
pavithra@pavithra-VirtualBox:~$ ifconfig
enp0s3    Link encap:Ethernet  HWaddr 08:00:27:23:41:65

Hadoop Single Node Cluster Installation

AIM:

To install Hadoop Single node cluster and run a simple application

ALGORITHM:

Step 1: Start

Step 2: If Java is not installed in your system then first download and install java under “C:\Java”

Step 3: Check whether Java 1.8.0 is installed on your system, use “Javac -version” to check.

Step 4: Extract file Hadoop 2.8.0.tar.gz or Hadoop-2.8.0.zip and place under “C:\hadoop-2.8.0”.

Step 5: Set the path (System Variable) HADOOP_HOME Environment variable on windows 10

Step 6: Set the path (System Variable) JAVA_HOME Environment variable on windows 10

Step 7: Set the Hadoop bin directory path and JAVA bin directory path (User variables).

Configuration

Step 1: Edit file C:/hadoop-2.8.0/etc/hadoop/core-site.xml, paste below xml paragraph and save this file.

```
<configuration>
<property>
<name>fs.defaultFS</name>
<value>hdfs://localhost:9000</value>
</property>
</configuration>
```

Step 2: Rename “mapred-site.xml.template” to “mapred-site.xml” and edit this file C:/hadoop-2.8.0/etc/hadoop/mapred-site.xml, paste below xml paragraph and save this file.

```
<configuration>
<property>
<name>mapreduce.framework.name</name>
<value>yarn</value>
</property>
</configuration>
```

Step 3: Create folder “data” under “C:\hadoop-2.8.0”

Create folder “datanode” under “C:\hadoop-2.8.0\data”

Create folder “namenode” under “C:\hadoop-2.8.0\data”

Step 4: Edit file C:\hadoop-2.8.0/etc/hadoop/hdfs-site.xml, paste below xml paragraph and save this file.

```
<configuration>
  <property>
    <name>dfs.replication</name>
    <value>1</value>
  </property>
  <property>
    <name>dfs.namenode.name.dir</name>
    <value>/hadoop-2.8.0/data/namenode</value>
  </property>
  <property>
    <name>dfs.datanode.data.dir</name>
    <value>/hadoop-2.8.0/data/datanode</value>
  </property>
</configuration>
```

Step 5: Edit file C:\hadoop-2.8.0/etc/hadoop/yarn-site.xml, paste below xml paragraph and save this file.

```
<configuration>
  <property>
    <name>yarn.nodemanager.aux-services</name>
    <value>mapreduce_shuffle</value>
  </property>
  <property>
    <name>yarn.nodemanager.auxservices.mapreduce.shuffle.class</name>
    <value>org.apache.hadoop.mapred.ShuffleHandler</value>
  </property>
</configuration>
```

Step 6: Edit file C:/hadoop-2.8.0/etc/hadoop/hadoop-env.cmd by closing the command line “JAVA_HOME=%JAVA_HOME%” instead of set “JAVA_HOME=C:\Java” (On C:\java this is path to file jdk.18.0)

Hadoop Configuration

1. Download folder from the below link and extract it
<https://drive.google.com/drive/folders/1qJxErQfEzVQBzOECcvzLRb8VXosfK0f1>
2. Delete the folder bin on C:\hadoop-2.8.0\bin, replaced by folder bin on file just download (from Hadoop Configuration.zip).
3. Open command prompt and type the command “hdfs namenode –format”.

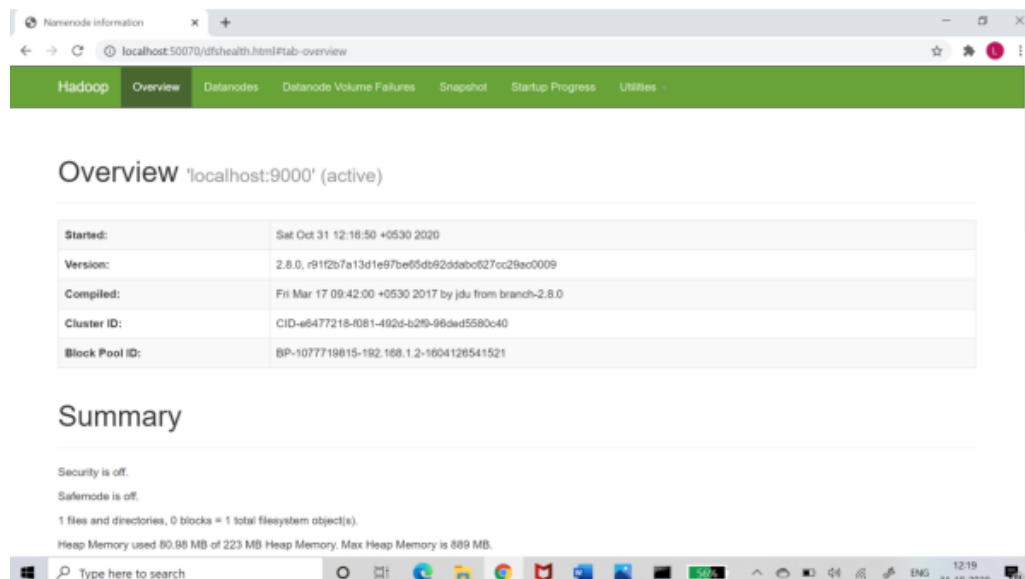

Testing

Step1: Open cmd and change directory to “C:\hadoop-2.8.0\sbin” and type “start-dfs.cmd” and “start-yarn.cmd” to start apache.

Step 2: Make sure these apps are running

- Hadoop Namenode
- Hadoop datanode
- YARN Resourc Manager
- YARN Node Manager

Step 3: Open: <http://localhost:50070>

RESULT:

Thus Hadoop Single node cluster is installed successfully

EX No: 9

CloudSim Programming

DATE:08.11.22

AIM:

To Simulate a cloud scenario using CloudSim and run a scheduling algorithm that is not present in CloudSim.

PROCEDURE:

1. Go to this website and download the cloudsims simulator “
<http://www.cloudbus.org/cloudsim/> ”.
 - a. This link would open a github account and then open the required version.
 - b. Download the zip file and extract it.
2. Open the netbeans create a new project
 - a. Choose java -> choose java application
 - b. Give name and then click finish
3. Click on libraries and add a library of cloudsims to the application.
4. Type the program you want to run.
5. Run the application and see the output in the output area.

PROGRAM:

```
package cloudsims;  
import java.text.DecimalFormat;  
import java.util.ArrayList;  
import java.util.Calendar;  
import java.util.LinkedList;  
import java.util.List;  
import org.cloudbus.cloudsim.Cloudlet;  
import org.cloudbus.cloudsim.CloudletSchedulerTimeShared;  
import org.cloudbus.cloudsim.Datacenter;  
import org.cloudbus.cloudsim.DatacenterBroker;  
import org.cloudbus.cloudsim.DatacenterCharacteristics;  
import org.cloudbus.cloudsim.Host;  
import org.cloudbus.cloudsim.Log;  
import org.cloudbus.cloudsim.Pe;  
import org.cloudbus.cloudsim.Storage;
```

```

import org.cloudbus.cloudsim.UtilizationModel;
import org.cloudbus.cloudsim.UtilizationModelFull;
import org.cloudbus.cloudsim.Vm;
import org.cloudbus.cloudsim.VmAllocationPolicySimple;
import org.cloudbus.cloudsim.VmSchedulerTimeShared;
import org.cloudbus.cloudsim.core.CloudSim;
import org.cloudbus.cloudsim.provisioners.BwProvisionerSimple;
import org.cloudbus.cloudsim.provisioners.PeProvisionerSimple;
import org.cloudbus.cloudsim.provisioners.RamProvisionerSimple;
/**
 * A simple example showing how to create a data center with one host and run one cloudlet on
 * it.
 */
public class Cloudsim {
/** The cloudlet list. */
private static List<Cloudlet> cloudletList;
/** The vm list. */
private static List<Vm> vmList;

/**
 * Creates main() to run this example.
 *
 * @param args the args
 */
@SuppressWarnings("unused")
public static void main(String[] args) {
Log.println("Starting CloudSimExample1...");
try {
// First step: Initialize the CloudSim package. It should be called
before creating any entities.

int num_user = 1; // number of cloud users
Calendar calendar = Calendar.getInstance(); // Calendar whose fields

```

have been initialized with the current date and time.

```
boolean trace_flag = false; // trace events
```

```
/* Comment Start - Dinesh Bhagwat
```

```
* Initialize the CloudSim library.
```

```
* init() invokes initCommonVariable() which in turn calls initialize()
```

(all these 3 methods are defined in CloudSim.java).

```
* initialize() creates two collections - an ArrayList of SimEntity
```

Objects (named entities which denote the simulation entities) and

```
* a LinkedHashMap (named entitiesByName which denote the LinkedHashMap
```

of the same simulation entities), with name of every SimEntity as the key.

```
* initialize() creates two queues - a Queue of SimEvents (future) and
```

another Queue of SimEvents (deferred).

```
* initialize() creates a HashMap of Predicates (with integers as  
keys) - these predicates are used to select a particular event from the deferred queue.
```

```
* initialize() sets the simulation clock to 0 and running (a boolean
```

flag) to false.

```
* Once initialize() returns (note that we are in method
```

initCommonVariable() now), a CloudSimShutDown (which is derived from SimEntity) instance
is
created

```
* (with numuser as 1, its name as CloudSimShutDown, id as -1, and
```

state as RUNNABLE). Then this new entity is added to the simulation

- * While being added to the simulation, its id changes to 0 (from the earlier -1). The two collections - entities and entitiesByName are updated with this SimEntity.

- * the shutdownId (whose default value was -1) is 0

- * Once initCommonVariable() returns (note that we are in method init() now), a CloudInformationService (which is also derived from SimEntity) instance is created

- * (with its name as CloudInformatinService, id as -1, and state as

RUNNABLE). Then this new entity is also added to the simulation.

- * While being added to the simulation, the id of the SimEntitiy is

changed to 1 (which is the next id) from its earlier value of -1.

- * The two collections - entities and entitiesByName are updated with

this SimEntity.

- * the cisId(whose default value is -1) is 1

- * Comment End - Dinesh Bhagwat

- */

```
CloudSim.init(num_user, calendar, trace_flag);
```

```
// Second step: Create Datacenters
```

```
// Datacenters are the resource providers in CloudSim. We need at
```

```
// list one of them to run a CloudSim simulation
```

```
Datacenter datacenter0 = createDatacenter("Datacenter_0");
```

```
// Third step: Create Broker
```

```
DatacenterBroker broker = createBroker();
```

```
int brokerId = broker.getId();
```

```
// Fourth step: Create one virtual machine
```

```

vmList = new ArrayList<Vm>();
// VM description
int vmid = 0;

int mips = 1000;
long size = 10000; // image size (MB)
int ram = 512; // vm memory (MB)
long bw = 1000;
int pesNumber = 1; // number of cpus
String vmm = "Xen"; // VMM name
// create VM
Vm vm = new Vm(vmid, brokerId, mips, pesNumber, ram, bw, size, vmm, new

CloudletSchedulerTimeShared());

// add the VM to the vmList
vmList.add(vm);
// submit vm list to the broker
broker.submitVmList(vmList);
// Fifth step: Create one Cloudlet
cloudletList = new ArrayList<Cloudlet>();
// Cloudlet properties
int id = 0;
long length = 400000;
long fileSize = 300;
long outputSize = 300;
UtilizationModel utilizationModel = new UtilizationModelFull();
Cloudlet cloudlet =

new Cloudlet(id, length, pesNumber, fileSize,
outputSize, utilizationModel, utilizationModel,
utilizationModel);
cloudlet.setUserId(brokerId);
cloudlet.setVmId(vmid);

```

```

// add the cloudlet to the list
cloudletList.add(cloudlet);
// submit cloudlet list to the broker
broker.submitCloudletList(cloudletList);
// Sixth step: Starts the simulation
CloudSim.startSimulation();
CloudSim.stopSimulation();
//Final step: Print results when simulation is over
List<Cloudlet> newList = broker.getCloudletReceivedList();
printCloudletList(newList);
Log.println("<CloudSimExample1 finished!>");
} catch (Exception e) {
e.printStackTrace();
Log.println("<Unwanted errors happen>");
}
}
/**
 * Creates the datacenter.
 *
 * @param name the name
 *
 * @return the datacenter
 */
private static Datacenter createDatacenter(String name) {
// Here are the steps needed to create a PowerDatacenter:
// 1. We need to create a list to store

// our machine
List<Host> hostList = new ArrayList<Host>();
// 2. A Machine contains one or more PEs or CPUs/Cores.
// In this example, it will have only one core.
List<Pe> peList = new ArrayList<Pe>();

OUTPUT:

The screenshot shows the GitHub release page for CloudSim 4.0. The page title is "CloudSim 4.0" and it is tagged on May 24, 2016, with 7 commits to master since this release. The page is divided into sections: "Changes from CloudSim 3.0.3 to CloudSim 4.0", "WHAT'S NEW", and "Assets". The "WHAT'S NEW" section lists two items: "added support for Container virtualization" and "lots of bugfixes". The "Assets" section lists four assets: "cloudsim-4.0.tar.gz" (3.47 MB), "cloudsim-4.0.zip" (3.48 MB), "Source code (zip)", and "Source code (tar.gz)".

CloudSimExample1 finished!
BUILD SUCCESSFUL (total time: 4 seconds)
```

RESULT:

The Simulation of a cloud scenario using CloudSim and running a scheduling algorithm that is not present in CloudSim was done and verified.

EX No: 10

Openstack Installation

DATE:08.11.22

AIM:

To install openstack with devstack

ALGORITHM:

Step 1: Start

Step 2: Log into your Ubuntu 18.04 system using SSH protocol and update & upgrade system repositories using the following command.

apt update -y && apt upgrade -y

Step 3: Reboot the system using the command.

sudo reboot

Step 4: To create stack user execute

sudo adduser -s /bin/bash -d /opt/stack -m stack

Step 5: Run the command below to assign sudo privileges to the user

**echo "stack ALL=(ALL) NOPASSWD: ALL" | sudo tee
/etc/sudoers.d/stack**

Step 6: Install git and download DevStack

su - stack

sudo apt install git -y

clone devstack's git repository as shown.

git clone https://git.openstack.org/openstack-dev/devstack

Step 7: Create devstack configuration file

cd devstack

Then create a local.conf configuration file.

vim local.conf

Paste the following content

[[local|localrc]]

Password for KeyStone, Database, RabbitMQ and Service

ADMIN_PASSWORD=StrongAdminSecret

DATABASE_PASSWORD=\$ADMIN_PASSWORD

RABBIT_PASSWORD=\$ADMIN_PASSWORD

SERVICE_PASSWORD=\$ADMIN_PASSWORD

**# Host IP - get your Server/VM IP address from ip addr
command**

HOST_IP=10.208.0.10

Save and exit the text editor.

Step 8: Install OpenStack with Devstack

Step 9: Accessing OpenStack on a web browser

<https://server-ip/dashboard>

OUTPUT:

```
root@ubuntu:/# apt update -y && apt upgrade -y
Hit:1 http://us-central1.gce.archive.ubuntu.com/ubuntu bionic InRelease
